Abstract. In this work, the mean square values of displacements and base accelerations in the vibrations of a hysteresis-type elastic dissipative characteristic beam with variable cross-section in combination with a hysteresis-type elastic dissipative characteristic dynamic absorber under the influence of random excitations were determined analytically depending on the system parameters. The effectiveness of the dynamic absorber was evaluated based on the expressions of the mean square values of displacements and base accelerations. The change in the damping efficiency at different values of the parameters was investigated. In particular, the change in the mean square values of displacements and base accelerations around the resonance frequency with a change in the parameter characterizing the spectral width was analyzed and conclusions were drawn.

Keywords: beam, dynamic absorber, hysteresis, random vibration, mean square value.

INTRODUCTION

In modern technology and equipment, the study of vibrations, taking into account the nonlinear dissipative characteristics of materials in machines, mechanisms, devices and their elements, and the determination of their dynamic characteristics as a result of stability and verification of their stability condition are considered urgent problems in terms of ensuring their long-term effective operation.

There are many scientific research works on mathematical modeling of vibrations of distributed parameter systems, taking into account their dissipative characteristics, and on checking the stability of their damping and harmful vibrations. In particular:

The work [1] considered transverse vibrations of a beam with a uniformly decreasing thickness starting from one end. The vibration velocity was analyzed. It was shown that the obtained differential equations have an exact solution. Based on these solutions, a new method for solving the beam equation when the thickness change is not parabolic is proposed, and conclusions are given.

The work [2] presented numerical methods for analyzing vibrations of beams with variable cross-section. The Ostrogradsky-Hamilton principle was used to obtain the equations of longitudinal, torsional and transverse vibrations of beams. The boundary value problems given by differential calculation methods under various boundary conditions were solved and analyzed.

The work [3] studied nonlinear free and forced vibrations of discrete and continuous systems. The systems are mathematically modeled using Lagrange equations, and solution methods are developed.

The work [4] theoretically studied nonlinear systems depending on the change in the stability parameters of motion. Theorems are presented for the separation of stable and unstable areas of system motion. The stability of motion of systems represented by non-homogeneous differential equations with periodic coefficients is analyzed.

The work [5] provides theoretical information on the harmonic balance method used to investigate the vibration of nonlinear systems. The nature of the nonlinear coefficients in the differential equation of motion of the system is analyzed. In addition, a method for determining the characteristic equation for systems with hysteresis-type elastic dissipative characteristics is shown and justified.

In the work [6], vibration forms of beams protected from vibrations were investigated by conducting experiments. The changes of the mode shapes with the change of frequencies are shown in the graphs, the conclusions about the effect of the frequencies on the mode shapes are drawn and the necessary recommendations are given.

In the work [7], the problems of determining the mode shapes, frequencies and optimal parameters of the joint vibrations of the second beam mounted on its free end as a dynamic absorber for a beam with one end free and the other end clamped were considered. In vibration damping, in addition to the ratio of the mass of the dynamic absorber to the mass of the beam, the damping efficiency is shown depending on the elastic properties of the beam installed as a dynamic absorber and its length. It was found that the flexibility properties and its length compared to the traditional dynamic absorber provided additional possibilities in the necessary design of this dynamic absorber.

In works [8-15], the theoretical foundations and applications of studying the dynamics and motion stability of nonlinear systems under the influence of various excitations are presented, and the issues of linearizing nonlinear characteristics are considered. The effectiveness of dynamic absorbers in various processes is evaluated.

Mathematical modeling of nonlinear mechanical systems, studying their dynamics, exploring the stability of their vibrations and reducing harmful vibrations at low and high frequencies were solved in the works [16-22]. The Stability behavior of the system was checked at different values of the parameters, conclusions were obtained as a result of numerical calculations.

The problem of determining the mean square values of nonlinear vibrations of a hysteresis-type elastic beam with a variable cross-section and a dynamic absorber under the influence of random excitations is one of the urgent problem.

MATERIALS AND METHODS

In this work, the problem of determining the mean square values of nonlinear vibrations of a hysteresis-type elastic beam with a variable cross-section and a dynamic absorber under the influence of random excitations was considered and numerically analyzed.

The system of differential equations of motion in transverse random vibrations of a hysteresis-type elastic beam with a variable cross-section and a dynamic absorber is expressed as follows as a result of the method of expanding the system into a series by eigenforms [22]:

$$\begin{aligned}
 & \ddot{q}_i + \{(1 + K_0(-\gamma_1 + j\gamma_2))p_i^2 + \frac{3E}{\rho F d_{2i}}(-\gamma_1 + j\gamma_2) \times \\
 & \times \sum_{k=1}^n K_k \sigma_{ia}^k \frac{h^k}{2^k(k+3)} \int_0^l I(x) u_i \frac{\partial^2}{\partial x^2} (\frac{\partial^2 u_i}{\partial x^2} |\frac{\partial^2 u_i}{\partial x^2}|^k) dx + \frac{E}{\rho F d_{2i}} \int_0^l \frac{\partial^2 I}{\partial x^2} u_i \frac{\partial^2 u_i}{\partial x^2} \times \\
 & \times \left[1 + K_0(-\gamma_1 + j\gamma_2) + 3(-\gamma_1 + j\gamma_2) \sum_{k=1}^n K_k \sigma_{ia}^k \frac{h^k}{2^k(k+3)} |\frac{\partial^2 u_i}{\partial x^2}|^k \right] dx + \\
 & + \frac{2E}{\rho F d_{2i}} \int_0^l \frac{\partial I}{\partial x} u_i \frac{\partial}{\partial x} |\frac{\partial^2 u_i}{\partial x^2}| [1 + K_0(-\gamma_1 + j\gamma_2) + 3(-\gamma_1 + j\gamma_2) \times \\
 & \times \sum_{k=1}^n K_k \sigma_{ia}^k \frac{h^k}{2^k(k+3)} |\frac{\partial^2 u_i}{\partial x^2}|^k] dx \} q_i - \mu \mu_0 u_{i0} n_0^2 (1 + (-\varphi_1 + j\varphi_2) \times \\
 & \times (H_0 + f(\sigma_{\zeta_{ot}}))) \zeta = -d_i \frac{\partial^2 w_0}{\partial t^2}; \\
 & u_{i0} \ddot{q}_i + \zeta + n_0^2 \left(1 + (-\varphi_1 + j\varphi_2) (H_0 + f(\sigma_{\zeta_{ot}})) \right) \zeta = -\frac{\partial^2 w_0}{\partial t^2},
 \end{aligned} \tag{1}$$

where $u = u(x)$; $u_{i0} = u(x_0)$; $n_0^2 = \frac{c}{m}$; $\mu = \frac{m}{\rho F l}$; $\mu_0 = \frac{l}{d_{2i}}$; $d_{1i} = \int_0^l u_i dx$; $d_{2i} = \int_0^l u_i^2 dx$; $\gamma_1, \gamma_2 = \gamma_2 \text{sign} \omega$ coefficients determined from the nonlinear functional expressing the dissipative properties of the beam material; E is the modulus of elasticity; $j = \sqrt{-1}$; ω is frequency of vibrations; c, m are the stiffness and mass of the dynamic absorber, respectively; ρ, F are the density and cross-sectional area of the beam material, respectively; $\delta(x)$ is the Dirac delta function; w_a is absolute displacement of the beam; σ_{ia} are absolute values of the mean square deviations of the beam; $f(\sigma_{\zeta_{ot}})$ is decrement of vibrations, $\sigma_{\zeta_{ot}}$ is a function of the mean square values of the relative

deformation, $f(\zeta_{ot}) = H_1 \sigma_{\zeta_{ot}} + H_2 \sigma_{\zeta_{ot}}^2 + \dots + H_s \sigma_{\zeta_{ot}}^s$, H_0, H_1, \dots, H_s are parameters of the hysteresis node determined experimentally, depending on the damping properties of the dynamic absorber material; φ_1, φ_2 are coefficients depending on the dissipative properties of the dynamic absorber material, determined from the hysteresis surface; K_0, K_1, \dots, K_r are experimentally determined parameters of the hysteresis node, which depend on the damping properties of the beam material; p_i are natural frequencies of the beam; $I(x) = \frac{bh^3}{12}$ is moment of inertia; $b = b(x)$, h and l are width, height and length of the beam, respectively; w is displacement of the base.

First, let's reduce the system of differential equations (1) to a system of algebraic equations using the differential operator $S = \frac{d}{dt}$. Introducing the substitution $S = j\omega$ into the resulting system of algebraic equations, it is possible to determine the variables q_i ($i = \overline{1, n}$) and ζ :

$$\begin{aligned} q_i &= \frac{A_{10} + jB_{10}}{A_2 + jB_2} W_0; \\ \zeta &= \frac{A_{20} + jB_{20}}{A_2 + jB_2} W_0, \end{aligned} \quad (2)$$

where

$$\begin{aligned} A_{10} &= d_i \omega^2 - (d_i + \mu \mu_0 u_{i0}) n_0^2 N_{01}; \quad B_{10} = -(d_i + \mu \mu_0 u_{i0}) n_0^2 N_{02}; \\ N_{01} &= 1 - \varphi_1 (H_0 + f(\zeta_{ot})); \quad N_{02} = \varphi_2 (H_0 + f(\zeta_{ot})); \\ A_{20} &= -p_i^2 N_{11} - p_i^2 - (u_{i0} d_i - 1) \omega^2; \quad B_{20} = -p_i^2 N_{12}; \\ N_{11} &= -K_0 \gamma_1 - \frac{3E}{\rho F d_{2i} p_i^2} \gamma_1 \sum_{k=1}^n K_k \sigma_{ia}^k \frac{h^k}{2^k (k+3)} \int_0^l I(x) u_i \frac{\partial^2}{\partial x^2} \left(\frac{\partial^2 u_i}{\partial x^2} \left| \frac{\partial^2 u_i}{\partial x^2} \right|^k \right) dx + \\ &+ \frac{E}{\rho F d_{2i} p_i^2} \int_0^l \frac{\partial^2 I(x)}{\partial x^2} u_i \frac{\partial^2 u_i}{\partial x^2} \left[1 - K_0 \gamma_1 - 3 \gamma_1 \sum_{k=1}^n K_k \sigma_{ia}^k \frac{h^k}{2^k (k+3)} \left| \frac{\partial^2 u_i}{\partial x^2} \right|^k \right] dx + \frac{2E}{\rho F d_{2i} p_i^2} \times \\ &\times \int_0^l \frac{\partial I(x)}{\partial x} u_i \frac{\partial}{\partial x} \left[\frac{\partial^2 u_i}{\partial x^2} \left[1 - K_0 \gamma_1 - 3 \gamma_1 \sum_{k=1}^n K_k \sigma_{ia}^k \frac{h^k}{2^k (k+3)} \left| \frac{\partial^2 u_i}{\partial x^2} \right|^k \right] \right] dx; \\ N_{12} &= K_0 \gamma_2 + \frac{3E}{\rho F d_{2i} p_i^2} \gamma_2 \sum_{k=1}^n K_k \sigma_{ia}^k \frac{h^k}{2^k (k+3)} \int_0^l I(x) u_i \frac{\partial^2}{\partial x^2} \left(\frac{\partial^2 u_i}{\partial x^2} \left| \frac{\partial^2 u_i}{\partial x^2} \right|^k \right) dx + \\ &+ \frac{E}{\rho F d_{2i} p_i^2} \int_0^l \frac{\partial^2 I(x)}{\partial x^2} u_i \frac{\partial^2 u_i}{\partial x^2} \left[1 + K_0 \gamma_2 + 3 \gamma_2 \sum_{k=1}^n K_k \sigma_{ia}^k \frac{h^k}{2^k (k+3)} \left| \frac{\partial^2 u_i}{\partial x^2} \right|^k \right] dx + \frac{2E}{\rho F d_{2i} p_i^2} \times \\ &\times \int_0^l \frac{\partial I(x)}{\partial x} u_i \frac{\partial}{\partial x} \left[\frac{\partial^2 u_i}{\partial x^2} \left[1 + K_0 \gamma_2 + 3 \gamma_2 \sum_{k=1}^n K_k \sigma_{ia}^k \frac{h^k}{2^k (k+3)} \left| \frac{\partial^2 u_i}{\partial x^2} \right|^k \right] \right] dx; \\ A_2 &= (p_i^2 - \omega^2 + p_i^2 N_{11}) (n_0^2 N_{01} - \omega^2) - p_i^2 n_0^2 N_{12} N_{02} - u_{i0}^2 \mu \mu_0 \omega^2 n_0^2 N_{01}; \\ B_2 &= (p_i^2 - \omega^2 + p_i^2 N_{11}) n_0^2 N_{02} + p_i^2 N_{12} (n_0^2 N_{01} - \omega^2) - u_{i0}^2 \mu \mu_0 \omega^2 n_0^2 N_{02}. \end{aligned}$$

Taking into account that the absolute acceleration of a hysteresis-type dissipative characteristic of a vibration-protected beam with variable cross-section consists of the sum of the relative acceleration and the base acceleration, and using expressions (2), we write the expression for the root mean square values of the absolute accelerations of the vibration-protected beam as follows:

$$\sigma_{W_0}^2 = \int_{-\infty}^{\infty} \left| 1 - u_i \omega^2 \frac{A_{10} + jB_{10}}{A_2 + jB_2} \right|^2 S_{W_0}(\omega) d\omega. \quad (3)$$

In order to calculate this integral expression, we obtain the following expression for the spectral density of the fundamental accelerations:

$$S_{W_0}(\omega) = \frac{D_{W_0} \alpha \omega_3^3}{\pi (\omega_3^2 - \omega^2 + j\alpha \omega_3 \omega) (\omega_3^2 - \omega^2 - j\alpha \omega_3 \omega)}, \quad (4)$$

where D_{W_0} is the dispersion of the fundamental acceleration; ω_3 is the frequency with the highest probability in the vibration spectrum; α is a parameter characterizing the width of the vibration spectrum.

As a result, the integral (3) is expressed in the following form:

$$\sigma_{W_0}^2 = R_* \int_{-\infty}^{+\infty} \frac{Y_6(\omega)}{Z_6(i\omega) Z_6(-i\omega)} d\omega, \quad (5)$$

where

$$Y_6(\omega) = a_{35} \omega^{10} + a_{34} \omega^8 + a_{33} \omega^6 + a_{32} \omega^4 + a_{31} \omega^2 + a_{30};$$

$$\begin{aligned}
Z_6(i\omega) &= t_6(i\omega)^6 + t_5(i\omega)^5 + t_4(i\omega)^4 + t_3(i\omega)^3 + t_2(i\omega)^2 + t_1(i\omega) + t_0; \\
a_{35} &= 0; a_{34} = (1 - d_i u_i)^2; \\
a_{33} &= 2((\mu\mu_0 u_0 + d_i)u_i - u_0^2 \mu\mu_0 + 1)N_{01}n_0^2 - p_i^2(N_{11} + 1)(1 - d_i u_i); \\
a_{32} &= (N_{01}^2 + N_{02}^2)(\mu\mu_0 u_0(u_0 - u_i) - d_i u_i + 1)^2 n_0^4 + \\
&+ 2(\mu\mu_0 u_0(u_0 - u_i)((N_{11} + 1)N_{01} + N_{12}N_{02}) - 2(N_{11} + 1)N_{01}(d_i u_i - 1))n_0^2 p_i^2 + ((N_{11} + 1)^2 + N_{12}^2)p_i^4; \\
a_{31} &= -2[(N_{11} + 1)(N_{01}^2 + N_{02}^2)(\mu\mu_0 u_0(u_0 - u_i) - d_i u_i + 1)n_0^2 + N_{01}((N_{11} + 1)^2 + N_{12}^2)p_i^2]n_0^2 p_i^2; \\
a_{30} &= ((N_{11} + 1)^2 + N_{12}^2)(N_{01}^2 + N_{02}^2)n_0^4 p_i^4.
\end{aligned}$$

The values of the integral (5) are as follows:

$$\sigma_{W_0}^2 = \frac{\pi R_*}{t_5} \frac{\begin{vmatrix} a_{35} & a_{34} & a_{33} & a_{32} & a_{31} & a_{30} \\ -t_6 & t_4 & -t_2 & t_0 & 0 & 0 \\ 0 & -t_5 & t_3 & -t_1 & 0 & 0 \\ 0 & t_6 & -t_4 & t_2 & -t_0 & 0 \\ 0 & 0 & t_5 & -t_3 & t_1 & 0 \\ 0 & 0 & -t_6 & t_4 & -t_2 & t_0 \end{vmatrix}}{\begin{vmatrix} t_5 & -t_3 & t_1 & 0 & 0 & 0 \\ -t_6 & t_4 & -t_2 & t_0 & 0 & 0 \\ 0 & -t_5 & t_3 & -t_1 & 0 & 0 \\ 0 & t_6 & -t_4 & t_2 & -t_0 & 0 \\ 0 & 0 & t_5 & -t_3 & t_1 & 0 \\ 0 & 0 & -t_6 & t_4 & -t_2 & t_0 \end{vmatrix}}, \quad (6)$$

where $R_* = \frac{D_{W_0} \alpha \omega_3^3}{\pi}$; $t_6 = 1$; $t_5 = \alpha \omega_3 + \delta_0$; $t_4 = \alpha \omega_3 \delta_0 + \omega_3^2 + \delta_1$; $t_3 = \omega_3^2 \delta_0 + \alpha \omega_3 \delta_1 + \delta_2$;

$$t_2 = \omega_3^2 \delta_1 + \alpha \omega_3 \delta_2 + \delta_3; t_1 = \omega_3^2 \delta_2 + \alpha \omega_3 \delta_3; t_0 = \omega_3^2 \delta_3;$$

$$\delta_3 = p_i^2 n_0^2 [(N_{11} + 1)N_{01} - N_{02}N_{12}]^2 + ((N_{11} + 1)N_{02} + N_{01}N_{12})^2]^{\frac{1}{2}};$$

$$\delta_0^2 - 2\delta_1 = \Delta_0;$$

$$\delta_1^2 - 2\delta_0\delta_2 + 2\delta_3 = \Delta_1;$$

$$\delta_2^2 - 2\delta_1\delta_3 = \Delta_2,$$

$$\Delta_0 = -2(p_i^2(1 + N_{11}) + (1 + \mu\mu_0 u_{i0}^2)n_0^2 N_{01});$$

$$\Delta_1 = 2p_i^2 n_0^2 ((1 + N_{11})N_{01} - N_{12}N_{02}) + ((1 + \mu\mu_0 u_{i0}^2)n_0^2 N_{01} + p_i^2(1 + N_{11}))^2 + ((1 + \mu\mu_0 u_{i0}^2)n_0^2 N_{02} + p_i^2 N_{12})^2;$$

$$\Delta_2 = -2n_0^2 p_i^2 [(N_{01}^2 + N_{02}^2)(1 + N_{11})(1 + \mu\mu_0 u_{i0}^2)n_0^2 + N_{01}p_i^2((1 + N_{11})^2 + N_{12}^2)].$$

We calculate the integral representing the root mean square displacements of a beam with a variable cross-section and elastic dissipative characteristics of the hysteresis type, and after some simplifications we write

$$\sigma_{q_i}^2 = \frac{1}{b_1 b_2 p_i^3} \frac{d_i^2 D_{W_0} (-b_1 \alpha^2 p_i \omega_3^3 - \alpha (b_1^2 \omega_3 p_i^2 + \omega_3^3) - b_1 b_2 p_i^3)}{b_2^2 p_i^4 + \alpha b_1 b_2 \omega_3 p_i^3 + (\alpha^2 b_2 - 2b_2 + b_1^2) p_i^2 \omega_3^2 + \alpha b_1 p_i \omega_3 + \omega_3^4}, \quad (8)$$

where

$$b_1 = [2(b_2 - 1 + N_{10i})]^{\frac{1}{2}};$$

$$b_2 = [(1 - N_{10i})^2 + (N_{20i})^2]^{\frac{1}{2}};$$

$$\begin{aligned}
N_{10i} &= \gamma_1 K_0 + \frac{1}{p_i^2} [\gamma_1 \frac{3E}{\rho F d_{2i}} \sum_{k=1}^n K_k \sigma_{ia}^k \frac{h^k}{2^k(k+3)} \int_0^l I(x) u_i \frac{\partial^2}{\partial x^2} \left(\frac{\partial^2 u_i}{\partial x^2} \left| \frac{\partial^2 u_i}{\partial x^2} \right|^k \right) dx - \\
&- \frac{E}{\rho F d_{2i}} \int_0^l \frac{\partial^2 I(x)}{\partial x^2} u_i \frac{\partial^2 u_i}{\partial x^2} \left[1 - \gamma_1 K_0 - 3\gamma_1 \sum_{k=1}^n K_k \sigma_{ia}^k \frac{h^k}{2^k(k+3)} \left| \frac{\partial^2 u_i}{\partial x^2} \right|^k \right] dx - \frac{2E}{\rho F d_{2i}} \times \\
&\times \int_0^l \frac{\partial I(x)}{\partial x} u_i \frac{\partial}{\partial x} \left[\frac{\partial^2 u_i}{\partial x^2} \left(1 - \gamma_1 K_0 - 3\gamma_1 \sum_{k=1}^n K_k \sigma_{ia}^k \frac{h^k}{2^k(k+3)} \left| \frac{\partial^2 u_i}{\partial x^2} \right|^k \right) \right] dx; \\
N_{20i} &= \gamma_2 K_0 + \frac{1}{p_i^2} [\frac{3E}{\rho F d_{2i}} \gamma_2 \sum_{k=1}^n K_k \sigma_{ia}^k \frac{h^k}{2^k(k+3)} \int_0^l I(x) u_i \frac{\partial^2}{\partial x^2} \left(\frac{\partial^2 u_i}{\partial x^2} \left| \frac{\partial^2 u_i}{\partial x^2} \right|^k \right) dx + \\
&+ \frac{E}{\rho F d_{2i}} \int_0^l \frac{\partial^2 I(x)}{\partial x^2} u_i \frac{\partial^2 u_i}{\partial x^2} \left[\gamma_2 K_0 + 3\gamma_2 \sum_{k=1}^n K_k \sigma_{ia}^k \frac{h^k}{2^k(k+3)} \left| \frac{\partial^2 u_i}{\partial x^2} \right|^k \right] dx + \frac{2E}{\rho F d_{2i}} \times
\end{aligned}$$

$$\times \int_0^l \frac{\partial I(x)}{\partial x} u_i \frac{\partial}{\partial x} \left[\frac{\partial^2 u_i}{\partial x^2} \left(\gamma_2 K_0 + 3\gamma_2 \sum_{k=1}^n K_k \sigma_{ia}^k \frac{h^k}{2^k(k+3)} \left| \frac{\partial^2 u_i}{\partial x^2} \right|^k \right) \right] dx;$$

The expression of the mean square values (8) makes it possible to determine and analyze the dynamics and stability of the beam's vibrations under the influence of random excitations at different values of the parameters.

RESULTS AND DISCUSSION

The beam material was 40X grade steel ($E = 2.08 \cdot 10^{11} \frac{N}{m^2}$; $\rho = 7810 \frac{kg}{m^3}$), and for the boundary value problem, a beam with one end clamped and the other end free was considered.

We numerically analyze the vibrations of a beam with one end fixed and one end free. The parameters are taken as follows: $l = 0.25$; $\gamma_1 = \frac{3}{4}$; $\gamma_2 = \frac{1}{\pi}$; $h = 2 \cdot 10^{-3}$; $K_0 = H_0 = 0$; $K_1 = 6.760624$; $K_2 = -8278.5937$; $K_3 = 5894761$;

For the case where the cross section is variable:

$$d_{11} = 195.6830992; d_{21} = 1.984833412 \cdot 10^{10}; \mu = 0.5; \mu_0 = 1.259551550 \cdot 10^{-11};$$

$$d_1 = 9.858918034 \cdot 10^{-9}; I_{1l} = 1.941963501 \cdot 10^{-11} m^4; m_1 = \mu \rho S_l h = 0.2335032198 kg;$$

$$N_{11} = 0.2160785846 \cdot 10^{-5} - 0.3059812236 \cdot 10^{-2} \sigma_{ia} + 269.8256554 \sigma_{ia}^2 - 1.471908755 \cdot 10^7 \sigma_{ia}^3;$$

$$N_{12} = 0.32892743 \cdot 10^{-5} + 0.1311697993 \cdot 10^{-2} \sigma_{ia} - 117.8134994 \sigma_{ia}^2 + 6.67251608 \cdot 10^6 \sigma_{ia}^3.$$

For the case where the cross section is unchanged:

$$N_{11} = -0.1988432491 \cdot 10^{-2} \sigma_{ia} + 174.097791 \sigma_{ia}^2 - 9.648472811 \cdot 10^6 \sigma_{ia}^3;$$

$$N_{12} = 0.84391696 \cdot 10^{-3} \sigma_{ia} - 73.88939738 \sigma_{ia}^2 + 4.094939045 \cdot 10^6 \sigma_{ia}^3.$$

In order to analyze the deviation of the resonance curves from the vertical, we draw graphs of the N_{11} function in cases where the cross-section of the beam is variable and constant.

Figure 1. Graphs of the deviation of the resonance curve from the vertical in cases where the cross-section of the beam is variable (blue) and constant (red)

Figure 1 shows the graphs of the deviation of the resonance curve from the vertical in the cases where the cross-sectional width of the beam is variable (blue) according to the law $b = 0.02 + 0.01 \sin(80x)$ and $b = 0.02$ is constant (red). From this it can be said that the deviation of the resonance curve from the vertical is less when the cross-sectional width of the beam is variable than when it is constant.

Figure 2. Energy distribution graphs for variable (blue) and constant (red) cross-sections of the beam

Figure2 shows the energy dissipation graphs for the cases where the cross-sectional width of the beam varies according to the law $b=0.02+0.01 \sin(80x)$ (blue) and $b=0.02$ is constant (red). From this it can be said that the energy dissipation is greater when the cross-sectional width of the beam varies than when it is constant.

Figure 3. (6) Graphs of root mean square absolute accelerations ($\alpha = 0.01$ (red); 0.08 (blue); 0.1 (black).)

Figure 3 shows graphs of the change in the mean square values of the absolute accelerations of the beam (6) depending on the frequency at which the vibration probability is high at the values of the parameter α ($\alpha = 0.01$ (red); 0.08 (blue); 0.1 (black)). From these graphs, it can be seen that with an increase in the parameter characterizing the spectrum width, the root mean square values of the absolute accelerations of the beam, which vary according to the law $b = 0.02 + 0.01 \sin(80x)$ decrease.

In order to analyze the dynamics of vibrations of a cross-section with elastic dissipative characteristics of the hysteresis type with a width of $b = 0.02 + 0.01 \sin(80x)$ and a constant width of $b = 0.02$ under the influence of

random excitations, we analyze the change in the graphs of the expression of the mean square values (8) depending on the frequency at which the vibration probability is high.

Figure 4. Changing the mean square values (8)
 $\alpha = 0.01$ (red); 0.08 (blue); 0.1 (black).

In the graphs in Fig. 4-a), the graphs of the expression of the mean square value (8) are presented for the cases where the cross-sectional width of the beam varies according to the law $b = 0.02 + 0.01 \sin(80x)$ and in Fig. 4-b) $b = 0.02$ is constant. From the graphs presented for both cases, it can be said that the mean square values of the beam with a variable cross-section are almost ten times smaller than in the case where the cross-section is constant. In addition, in both cases, an increase in the parameter α , which characterizes the width of the vibration spectrum, does not change the mean square value around the resonant frequency, but at a sufficient distance from the resonant frequency leads to an increase in the mean square value.

CONCLUSION

The expressions of the mean square values of the displacements and base accelerations of a beam with a hysteresis-type elastic dissipative characteristic with a variable cross-section were numerically analyzed. The changes in the mean square values of the displacements and base accelerations at different values of the parameters were shown on the basis of graphs, and the corresponding conclusions were drawn. It was shown that the deviation of the resonance curve from the vertical was less in the case of a beam with a hysteresis-type elastic dissipative characteristic with a variable cross-section than in the case of a fixed one. It was shown that the energy dissipation was greater in the case of a beam with a hysteresis-type elastic dissipative characteristic with a variable cross-section than in the case of a fixed one. The nonlinear vibrations of a hysteresis-type dissipative beam with a variable cross-section under the influence of random excitations were mathematically modeled and their mean square values were determined analytically for the general case depending on the system parameters. The expressions of the root mean square values of the displacements of a hysteresis-type dissipative beam with a variable cross-section were numerically analyzed. The changes in the root mean square values of the displacements at different values of the parameters were shown on the basis of graphs and the corresponding conclusions were drawn.

LICENSE TO PUBLISH AGREEMENT FOR CONFERENCE PROCEEDINGS

This License to Publish must be signed and returned to the Proceedings Editor before the manuscript can be published. If you have questions about how to submit the form, please contact the AIP Publishing Conference Proceedings office (confproc@aip.org). For questions regarding the copyright terms and conditions of this License, please contact AIP Publishing's Office of Rights and Permissions, 1305 Walt Whitman Road, Suite 300, Melville, NY 11747-4300 USA; Phone 516-576-2268; Email: rights@aip.org.

Article Title ("Work"):

All Author(s):

Title of Conference:

Name(s) of Editor(s)

All Copyright Owner(s), if not Author(s):

(Please list all copyright owner(s) by name. In the case of a Work Made for Hire, the employer(s) or commissioning party(ies) are the copyright owner(s). For large groups of copyright owners, attach a separate list to this form.)

Copyright Ownership and Grant of Rights

For the purposes of this License, the "Work" consists of all content within the article itself and made available as part of the article, including but not limited to the abstract, tables, figures, graphs, images, and multimedia files, as well as any subsequent errata. "Supplementary Material" consists of material that is associated with the article but linked to or accessed separately (available electronically only), including but not limited to data sets and any additional files.

This Agreement is an Exclusive License to Publish not a Transfer of Copyright. Copyright to the Work remains with the Author(s) or, in the case of a Work Made for Hire, with the Author(s)/ employer(s). AIP Publishing LLC shall own and have the right to register in its name the copyright to the proceedings issue or any other collective work in which the Work is included. Any rights granted under this License are contingent upon acceptance of the Work for publication by AIP Publishing. If for any reason and at its own discretion AIP Publishing decides not to publish the Work, this License is considered void.

Each Copyright Owner hereby grants to AIP Publishing LLC the following irrevocable rights for the full term of United States and foreign copyrights (including any extensions):

1. The exclusive right and license to publish, reproduce, distribute, transmit, display, store, translate, edit, adapt, and create derivative works from the Work (in whole or in part) throughout the world in all formats and media whether now known or later developed, and the nonexclusive right and license to do the same with the Supplementary Material.
2. The right for AIP Publishing to freely transfer and/or sublicense any or all of the exclusive rights listed in #1 above. Sublicensing includes the right to authorize requests for reuse of the Work by third parties.
3. The right for AIP Publishing to take whatever steps it considers necessary to protect and enforce, at its own expense, the exclusive rights granted herein against third parties.

Author Rights and Permitted Uses

Subject to the rights herein granted to AIP Publishing, each Copyright Owner retains ownership of copyright and all other proprietary rights such as patent rights in the Work.

Each Copyright Owner retains the following nonexclusive rights to use the Work, without obtaining permission from AIP Publishing, in keeping with professional publication ethics and provided clear credit is given to its first publication in an AIP Publishing proceeding. Any reuse must include a full credit line acknowledging AIP Publishing's publication and a link to the Version of Record (VOR) on AIP Publishing's site.

Each Copyright Owner may:

1. Reprint portions of the Work (excerpts, figures, tables) in future works created by the Author, in keeping with professional publication ethics.
2. Post the Accepted Manuscript (AM) to their personal web page or their employer's web page immediately after acceptance by AIP Publishing.
3. Deposit the AM in an institutional or funder-designated repository immediately after acceptance by AIP Publishing.

4. Use the AM for posting within scientific collaboration networks (SCNs). For a detailed description of our policy on posting to SCNs, please see our Web Posting Guidelines (<https://publishing.aip.org/authors/web-posting-guidelines>).
5. Reprint the Version of Record (VOR) in print collections written by the Author, or in the Author's thesis or dissertation. It is understood and agreed that the thesis or dissertation may be made available electronically on the university's site or in its repository and that copies may be offered for sale on demand.
6. Reproduce copies of the VOR for courses taught by the Author or offered at the institution where the Author is employed, provided no fee is charged for access to the Work.
7. Use the VOR for internal training and noncommercial business purposes by the Author's employer.
8. Use the VOR in oral presentations made by the Author, such as at conferences, meetings, seminars, etc., provided those receiving copies are informed that they may not further copy or distribute the Work.
9. Distribute the VOR to colleagues for noncommercial scholarly use, provided those receiving copies are informed that they may not further copy or distribute the Work.
10. Post the VOR to their personal web page or their employer's web page 12 months after publication by AIP Publishing.
11. Deposit the VOR in an institutional or funder-designated repository 12 months after publication by AIP Publishing.
12. Update a prior posting with the VOR on a noncommercial server such as arXiv, 12 months after publication by AIP Publishing.

Author Warranties

Each Author and Copyright Owner represents and warrants to AIP Publishing the following:

1. The Work is the original independent creation of each Author and does not infringe any copyright or violate any other right of any third party.
2. The Work has not been previously published and is not being considered for publication elsewhere in any form, except as a preprint on a noncommercial server such as arXiv, or in a thesis or dissertation.
3. Written permission has been obtained for any material used from other sources and copies of the permission grants have been supplied to AIP Publishing to be included in the manuscript file.
4. All third-party material for which permission has been obtained has been properly credited within the manuscript.
5. In the event that the Author is subject to university open access policies or other institutional restrictions that conflict with any of the rights or provisions of this License, such Author has obtained the necessary waiver from his or her university or institution.

This License must be signed by the Author(s) and, in the case of a Work Made for Hire, also by the Copyright Owners. One Author/Copyright Owner may sign on behalf of all the contributors/owners only if they all have authorized the signing, approved of the License, and agreed to be bound by it. The signing Author and, in the case of a Work Made for Hire, the signing Copyright Owner warrants that he/she/it has full authority to enter into this License and to make the grants this License contains.

1. The Author must please sign here (except if an Author is a U.S. Government employee, then please sign under #3 below):

Author(s) Signature	Print Name	Date
---------------------	------------	------

2. The Copyright Owner (if different from the Author) must please sign here:

Name of Copyright Owner	Authorized Signature and Title	Date
-------------------------	--------------------------------	------

3. If an Author is a U.S. Government employee, such Author must please sign below.

The signing Author certifies that the Work was written as part of his/her official duties and is therefore not eligible for copyright protection in the United States.

Name of U.S. Government Institution (e.g., Naval Research Laboratory, NIST)

Author Signature	Print Name	Date
------------------	------------	------

PLEASE NOTE: NATIONAL LABORATORIES THAT ARE SPONSORED BY U.S. GOVERNMENT AGENCIES BUT ARE INDEPENDENTLY RUN ARE NOT CONSIDERED GOVERNMENT INSTITUTIONS. (For example, Argonne, Brookhaven, Lawrence Livermore, Sandia, and others.) Authors at these types of institutions should sign under #1 or #2 above.

If the Work was authored under a U.S. Government contract, and the U.S. Government wishes to retain for itself and others acting on its behalf, a paid-up, nonexclusive, irrevocable, worldwide license in the Work to reproduce, prepare derivative works from, distribute copies to the public, perform publicly, and display publicly, by or on behalf of the Government, please check the box below and add the relevant Contract numbers.

☐ Contract #(s) _____ [1.16.1]

LICENSE TERMS DEFINED

Accepted Manuscript (AM): The final version of an author's manuscript that has been accepted for publication and incorporates all the editorial changes made to the manuscript after submission and peer review. The AM does not yet reflect any of the publisher's enhancements to the work such as copyediting, pagination, and other standard formatting.

arXiv: An electronic archive and distribution server for research article preprints in the fields of physics, mathematics, computer science, quantitative biology, quantitative finance, and statistics, which is owned and operated by Cornell University, <http://arxiv.org/>.

Commercial and noncommercial scholarly use: *Noncommercial* scholarly uses are those that further the research process for authors and researchers on an individual basis for their own personal purposes. They are author-to-author interactions meant for the exchange of ideas. *Commercial* uses fall outside the author-to-author exchange and include but are not limited to the copying or distribution of an article, either in hard copy form or electronically, for resale or licensing to a third party; posting of the AM or VOR of an article by a site or service where an access fee is charged or which is supported by commercial paid advertising or sponsorship; use by a for-profit entity for any type of promotional purpose. Commercial uses require the permission of AIP Publishing.

Embargo period: The period of time during which free access to the full text of an article is delayed.

Employer's web page: A web page on an employer's site that highlights the accomplishments and research interests of the company's employees, which usually includes their publications. (See also: Personal web page and Scholarly Collaboration Network).

Exclusive License to Publish: An exclusive license to publish is a written agreement in which the copyright owner gives the publisher exclusivity over certain inherent rights associated with the copyright in the work. Those rights include the right to reproduce the work, to distribute copies of the work, to perform and display the work publicly, and to authorize others to do the same. The publisher does not hold the copyright to the work, which continues to reside with the author. The terms of the AIP Publishing License to Publish encourage authors to make full use of their work and help them to comply with requirements imposed by employers, institutions, and funders.

Full Credit Line: AIP Publishing's preferred format for a credit line is as follows (you will need to insert the specific citation information in place of the capital letters): "Reproduced from [FULL CITATION], with the permission of AIP Publishing." A FULL CITATION would appear as: Journal abbreviation, volume number, article ID number or page number (year). For example: Appl. Phys. Lett. 107, 021102 (2015).

Institutional repository: A university or research institution's digital collection of articles that have been authored by its staff and which are usually made publicly accessible. As authors are encouraged and sometimes required to include their published articles in their institution's repository, the majority of publishers allow for deposit of the Accepted Manuscript for this purpose. AIP Publishing also allows for the VOR to be deposited 12 months after publication of the Work.

Journal editorial office: The contact point for authors concerning matters related to the publication of their manuscripts. Contact information for the journal editorial offices may be found on the journal websites under the "About" tab.

Linking to the Version of Record (VOR): To create a link to your article in an AIP Publishing journal or proceedings, you need to know the CrossRef digital object identifier (doi). You can find the doi on the article's abstract page. For instructions on linking, please refer to our Web Posting Guidelines at <https://publishing.aip.org/authors/web-posting-guidelines>.

National Laboratories: National laboratories are sponsored and funded by the U.S. Government but have independent nonprofit affiliations and employ private sector resources. These institutions are classified as Federally Funded Research and Development Centers (FFRDCs). Authors working at FFRDCs are not

considered U.S. Government employees for the purposes of copyright. The Master Government List of FFRDCs may be found at <http://www.nsf.gov/statistics/ffrdclist/>.

Personal web page: A web page that is hosted by the author or the author's institution and is dedicated to the author's personal research interests and publication history. An author's profile page on a social media site or scholarly collaboration network site is *not* considered a personal web page. (See also: Scholarly Collaboration Network; Employer's web page).

Peer X-Press: A web-based manuscript submission system by which authors submit their manuscripts to AIP Publishing for publication, communicate with the editorial offices, and track the status of their submissions. The Peer X-Press system provides a fully electronic means of completing the License to Publish. A hard copy of the Agreement will be supplied by the editorial office if the author is unable to complete the electronic version of the form. (Conference Proceedings authors will continue to submit their manuscripts and forms directly to the Conference Editors.)

Preprint: A version of an author's manuscript intended for publication but that has not been peer reviewed and does not reflect any editorial input or publisher enhancements.

Professional Publication Ethics: AIP Publishing provides information on what it expects from authors in its "Statement of ethics and responsibilities of authors submitting to AIP Publishing journals" (<http://publishing.aip.org/authors/ethics>). AIP Publishing is also a member of the Committee on Publication Ethics (COPE) (<http://publicationethics.org/>), which provides numerous resources and guidelines for authors, editors, and publishers with regard to ethical standards and accepted practices in scientific publishing.

Scholarly Collaboration Network (SCN): Professional networking sites that facilitate collaboration among researchers as well as the sharing of data, results, and publications. SCNs include sites such as Academia.edu, ResearchGate, and Mendeley, among others.

Supplementary Material: Related material that has been judged by peer review as being relevant to the understanding of the article but that may be too lengthy or of too limited interest for inclusion in the article itself. Supplementary Material may include data tables or sets, appendixes, movie or audio clips, or other multimedia files.

U.S. Government employees: Authors working at Government organizations who author works as part of their official duties and who are not able to license rights to the Work, since no copyright exists. Government works are in the public domain within the United States.

Version of Record (VOR): The final published version of the article as it appears in the printed journal/proceedings or on the Scitation website. It incorporates all editorial input, is formatted in the publisher's standard style, and is usually viewed in PDF form.

Waiver: A request made to a university or institution to exempt an article from its open-access policy requirements. For example, a conflict will exist with any policy that requires the author to grant a nonexclusive license to the university or institution that enables it to license the Work to others. In all such cases, the Author must obtain a waiver, which shall be included in the manuscript file.

Work: The "Work" is considered all the material that comprises the article, including but not limited to the abstract, tables, figures, images, multimedia files that are directly embedded within the text, and the text itself. The Work does not include the Supplementary Material (see Supplementary Material above).

Work Made for Hire: Under copyright law, a work prepared by an employee within the scope of employment, or a work that has been specially ordered or commissioned for which the parties have agreed in writing to consider as a Work Made for Hire. The hiring party or employer is considered the author and owner of the copyright, not the person who creates the work.
